

RYAN MORENO

SOFTWARE ENGINEER

Miami, FL | (210) 428-8320 | morenoryan33@gmail.com

[LinkedIn](#) | [GitHub](#)

PROFESSIONAL SUMMARY

Full-stack software engineer who builds web applications, AI-powered automation, and data-processing systems end to end — React / Next.js and TypeScript on the frontend, Node.js on the backend. Recent work spans AI automation pipelines, a multi-marketplace commerce platform, and RAG-powered developer tooling.

PROFESSIONAL EXPERIENCE

Reina LLC

Software Engineer (Contract)

Remote

2021 – 2022

Influencer Discovery & Outreach Automation — Influencer Marketing Services

- Built an automated influencer-discovery pipeline in n8n that scouts creators against defined criteria, replacing manual sourcing and multiplying outreach-team throughput.
- Designed and wrote the multi-factor ranking algorithm at the core of the pipeline — a weighted scoring function that grades each scouted creator against fit criteria and outputs a ranked score, so outreach prioritizes the highest-value prospects first.
- Re-architected the discovery system from the n8n workflow into a native TypeScript service, adding request batching and parallelization to query social-platform data (TikTok, Instagram) at higher speed and volume.

Stack: TypeScript, n8n, Redis, Redux Toolkit (RTK), Supabase, OpenAI SDK

AI Ticket-Generation Tool — Codebase-Aware Engineering Workflow

- Built a full-stack tool (Next.js frontend → n8n orchestration → LLM) that turns a feature objective plus codebase context into structured, ready-to-work ClickUp / JIRA tickets, replacing manual ticket writing.
- Implemented a RAG pipeline over the codebase with Supabase pgvector — indexing GitHub branches, semantically chunking source files, and retrieving the most relevant code so generated tickets reference real implementation detail.

Stack: TypeScript, React / Next.js, n8n, Supabase (pgvector), GitHub API, LLMs / RAG

Felipa

Software Engineer (Contract) · AI personal-finance app

Remote

2023 – 2024

- Built the reporting UI for a consumer personal-finance app that uses an LLM to summarize users' bank activity, integrating Plaid to securely connect accounts and feed transaction data into the summarization layer.
- Made the app multi-platform from a single codebase — packaging the web app for iOS and Android with Capacitor.

Stack: TypeScript, React, Capacitor, Plaid API, LLMs

RMoreno LLC

Software Engineer · ryventory (independent product)

Remote

2025 – Present

- Built an event-driven crosslisting engine that syncs inventory across eBay, Shopify, and other marketplaces and auto-delists sold items, using webhook subscriptions and a Redis-backed job queue with idempotency to prevent overselling.
- Integrated the Shopify GraphQL Admin API to run the storefront as POS and source of truth, and built a photo-based pricing tool that uses a multimodal LLM with market comps from PriceCharting and eBay.
- Designed and built the application end to end — the full Next.js / React UI and component library on a custom design system, plus Supabase Auth and the normalized Product → Item → Listing data model.
- Built a catalog entity-resolution engine that resolves incoming items (barcode misses, LLM identification, manual entry) to canonical Product records, using token-based fuzzy matching with blocking to skip $O(n^2)$ comparisons and confidence thresholds that auto-merge clear matches and route the rest to review.

Stack: TypeScript, React / Next.js, Node.js, Supabase, Redis, Shopify GraphQL API

EDUCATION

Miami Dade College

B.S. in Information Systems Technology — Software Engineering Concentration

Miami, FL

2018 – 2021

Thinkful

Certificate, Software Engineering

Remote

2021 – 2022

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, Go, Java, Bash, SQL, HTML5, CSS3

Frontend: React, Next.js, Redux / RTK, React Native, Vue / Nuxt, Tailwind, Material UI, SASS

Backend & Data: Node.js, Express, REST, GraphQL, n8n, PostgreSQL, MySQL, MongoDB, Supabase, Redis

AI, DevOps & Tools: OpenAI SDK, LLMs, RAG, AWS (IAM, S3, Lambda, ECS, CloudWatch), Git, GitHub, Docker
